Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1147

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (rejactivate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC (BCNG) of the invention, designated mBONG-2. BCNG and BCNG-related CC proteins are useful in screening for compounds that modulate, interact or CC affect expression. Compounds, e.g. antagonists and agonists, identified CC in the methods are useful for modulating BCNG or BCNG-related protein CC activity. Modulation is increased or decreased ion permissivity or ion CC flow rate. Modulators of BCNG, can be used to treat a neurological, renal, CC pulmonary, hepatic or cardiovascular condition. Such conditions include epilepsy, Alzheimer's Disease, Parkinson's Disease, long OT syndrome, CC epilepsy, Alzheimer's Disease, Parkinson's Disease, long OT syndrome, CC death syndrome or pacemaker rhythm dysfunction. BCNG or BCNG-related CC protein can also be used to treat sensory disorders, e.g. blindness, loss of vision, loss of smell, numbness and lack of ability to taste. Also central nervous system areas that control respiration or defects in the drugs, dyslexia, attention deficit disorder or learning disabilities, cc drug addiction and regulation of cell secretions. The proteins are useful targets for screening for drugs that are effective in the control of pain
                                                                                                                                                                                                                                                                                                            밁

Fragments of the Ih ion channel nucleic acid are used to detect mutations e.g. for differential diagnosis. This sequence encodes a human Ih channel fragment isolated from human thalamus tissue.

The ion channels of the invention have analyesic and cardioactive activity. The Ih ion channel participates in the pacemaker function in cardiac muscle. The Ih ion channel nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  have analgesic and cardioactive activity. The Ih ion channel participates in the pacemaker function in cardiac muscle. The Ih ion channel nucleic acid and its encoding protein is used to identify substances (A) that modulate activity of ion channels; to treat and/or diagnose ion channel-related diseases, particularly cardiac or circulatory disorders and to prevent and/or treat cardiac/circulatory disorders (especially faulty regulation of the sinus gangilon), sleep disorders (particularly abnormal function of cortico-thalamic neurons) and/or pain. Fragments of the Ih ion channel nucleic acid are used to detect mutations e.g. for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid and its encoding protein is used to identify substances (A) that modulate activity of ion channels; to treat and/or diagnose ion channel related diseases, particularly cardiac or circulatory disorders and to prevent and/or treat cardiac/circulatory disorders (especially faulty regulation of the sinus ganglion), sleep disorders (particularly abnormal function of cortico-thalamic neurons) and/or pain. Fragments of the Ih ion channel nucleic acid are used to detect mutations e.g. for differential diagnosis. This sequence encodes a human Ih channel fragment isolated from human thalamus tissue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel Ih ion channel, isolated from human, sea urchin, bovine, rat, and fruitfly. The ion channels of the invention have analyesic and cardioactive activity. The Ih ion channel participates in the pacemaker function in cardiac muscle. The Ih ion channel nucleic

They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilisation (chemotaxis) of immune cells. The etiology of these immune deficiencies or disorders may be genetic, souch as cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or toxins), or infectious. They can also be used for detection and diagnosis. 232002 to 232080, and Y49503 to Y49511 represent sequences given in the exemplification of the present

This morphogen is inactive when reduced but is active as an oxidised homodimer and when oxidised in combination with other morphogens. These morphogens are capable of stimulating proliferation of progenitor cell, stimulating the differentiation of progenitor cells, stimulating the proliferation of

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed; and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Anote Torgan: colon; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from colon adenocarcinoma, and was then primed with a Not I coligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

                                                                                      (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco R; Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479.

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-68729, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo."

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. " 1 others
